## Documentum ApplicationXtender 5

### Highlights

- Rapid deployment and easy administration for fixed content management solutions
- High-speed content imaging and enterprise report management processing, indexing, and archival (COLD)
- Support for Windows Server 2003 and Microsoft .NET framework for creating high-performance, easy-to-deploy packaged content applications
- Easy integration with existing business applications—without programming
- Direct access to stored documents, reports, and information from virtually any desktop business application

### A Content Management Solution that is Easy to Deploy, Easy to Administer

*Business is fueled by information—yet in today's challenging environment, business professionals struggle constantly with how to manage and protect their critical documents and business information assets. Greater control over that information means greater control of the entire business. That's the value of content management—and with Documentum ApplicationXtender, content management is easier than ever to implement.*

### Fixed Content Imaging and Report Management on Windows

With its out-of-the-box capabilities, Documentum ApplicationXtender 5 allows you to quickly create an “electronic file cabinet” for information, enabling the capture, organization, and delivery of fixed content images, documents, reports, and other business-critical information. Built on a central repository, ApplicationXtender provides specific capabilities for high-speed image capture and storage and is designed for quick deployment. With ApplicationXtender, you quickly access information from a universal desktop interface, enabling greater control over business documents, enhancing the quality of decisions, increasing customer service levels, and improving employee productivity.

And ApplicationXtender is easy to administer. You can quickly deploy content management without programming or extensive customization, saving a substantial amount of time and money for your organization. Using a Web-based tool, XAdmin, administrators can centrally configure and manage application resources such as application templates and repository parameters, storage devices, and business rules. Remote application management and monitoring services offer a central view of the application environment, enabling proactive management of application services and related resources.

### Optimized for Microsoft Windows

With an enhanced Web architecture built on the Microsoft .NET framework, Documentum ApplicationXtender offers simplified Web deployment and advanced functionality for managing content such as invoices, statements, account records, customer and patient files, and other business information. ApplicationXtender

provides users with full access to the central repository and content services through a browser-based interface. With its support for Windows Server 2003, ApplicationXtender takes full advantage of Windows NT and Active Directory Services, offering access control, secure communications, verifiable transactions, and support for digital signatures.

#### High-Speed Content Imaging and Report Management

Documents and images can be quickly scanned, stored, searched, and shared to automate paper-based processes, improve customer service, increase productivity, and streamline business processes. For geographically distributed organizations, ApplicationXtender enables Web-based remote scanning and distributed capture. The enhanced report management services of Documentum ApplicationXtender deliver high-speed computer output to laser disk (COLD) processing, indexing, and archival for computer-generated output such as text-based print files and advanced print stream formats for management of enterprise reports.

#### Quick Integration with Existing Business Applications

Documentum ApplicationXtender delivers a revolutionary new technology for providing end-user access to relevant business documents from within existing applications. ApplicationXtender Integration Module (AXIM), an add-on module for ApplicationXtender, allows companies to quickly “image-enable” virtually any application without programming. Users can then request and retrieve stored document images and information from within whatever business application they are using. For example, customer call center employees can retrieve all documents relevant to a specific customer, account, or transaction from within the primary application interface. AXIM also provides the ability to leverage voice commands to initiate retrieval.

#### About Documentum

Documentum, a division of EMC, provides enterprise content management solutions that enable organizations to unite teams, content, and associated business processes. Documentum’s integrated set of content, compliance, and collaboration solutions support the way people work, from initial discussion and planning through design, production, marketing, sales, service, and corporate administration. With a single platform, Documentum enables people to collaboratively create, manage, deliver, and archive the content that drives business operations, from documents and discussions to e-mail, Web pages, records, and rich media. The Documentum platform makes it possible for companies to distribute all of this content in multiple languages, across internal and external systems, applications, and user communities. As a result, Documentum customers, which include thousands of the world’s most successful organizations, harness corporate knowledge, accelerate time to market, increase customer satisfaction, enhance supply chain efficiencies, and reduce operating costs, improving their overall competitive advantage.
